# **GENERAL EMBRYOLOGICAL INFORMATION SERVICE**

**1959**

(eighth issue)

**ISSUED BY THE HUBRECHT LABORATORY**

# INTRODUCTION

Subscribers are herewith receiving the eighth full issue, containing the new data collected during 1959.

Up till now the periodical has contained almost exclusively zoological data. The progress of research has shown that, particularly in the field of developmental biology, the distinction between zoology and botany is artificial. Many problems attacked by botanists are closely related to those on which zoologists are working. Therefore the periodical will henceforth embrace developmental biology in general, particularly in so far as its experimental aspects are concerned. For the time being the data on experimental developmental morphology of plants are listed in a separate section of the "List of subjects" (see page 217). The number of data collected this year is still limited, but we expect that it will increase during the coming years. Suggestions for further improvement will be gratefully considered.

Contacts have this time been established with Eastern Germany, and the contacts with India, Czechoslovakia, Hungary and Western Germany have been extended.

From 1950 till 1957 the subscription price has undergone no change, notwithstanding the fact that the coverage and size of the periodical have increased considerably (number of collaborators by about 50 %, number of institutes by about 75 %, and number of pages by about 50 %). Moreover a number of new chapters were opened during this period. In order to keep the periodical "self-supporting", an increase of the subscription price has become unavoidable. As already announced in the Supplement to the seventh issue, *for the coming years the price has been fixed at H.fl. 28.50 (i.e. \$ 7.50).*

## I The team work project

Contrary to the information given in the supplement to the seventh issue, the *fourth international team work* will be held in 1960. However, owing to the rapid extension of the staff of the laboratory the accomodation in the present building does not allow the organization of a "normal" team, so that the fourth team will consist of a limited number of invited members only. Among these there will be several scientists whose applications for previous teams could not be realized.

Only a very provisional list of participants can be given at the present time:  
Dr. R. Azoubel, Recife, Brazil  
Mr. V. Labordus, Utrecht, Holland  
Dr. M. Michael, Alexandria, Egypt  
Dr. K. Rzehak, Krakow, Poland  
Dr. G. Székely, Pécs, Hungary

.....

The team work will be held from January 1st till July 31st under the personal direction of Dr. P. D. Nieuwkoop and with the assistance of the other members of the staff.

The general topic will be: "Experimental studies of basic mechanisms acting in successive phases of vertebrate morphogenesis". It is hoped that the fourth team work will be the last one held in the old building, and that it will be possible to receive the fifth team in the new building, which may be ready in 1962 or 1963. The more or less firmly established tradition of the organization of an international team work every second year will in this way be interfered with as little as possible.

## II The building project

The present building not only offers insufficient accommodation for the rapidly expanding staff of the institute and for the increasing number of foreign workers, but it also greatly restricts the development of the research programme itself. Embryology is a science which develops very rapidly; many new methods have been introduced in the last decade, leading to new forms of approach and to new subfields of science.

The new building will therefore provide accommodation for several new fields of research. Besides descriptive and comparative embryology and the already well established field of experimental morphology, which together form the trunk upon which the new branches can be grafted, histo- and cytochemical analysis of development, the method of tissue culture, developmental genetics, developmental physiology and biophysical analysis of developmental processes will receive adequate accommodation, while an additional research unit will be reserved for new, still unknown offshoots.

This programme will lead to a considerable extension of the scientific staff and consequently of the technical staff as well.

First of all tissue culture research will be developed by Mrs. H. Sobel from Jerusalem. With this a beginning will be made while still in the old building. In the coming years the other units will be developed one after the other.

### III The Central Embryological Library (C.E.L.)

#### A *The reprint collection*

The collection at present comprises a total number of about 20 000 titles. Every year nearly 2000 papers are added. Part of these are received on a basis of exchange against publications issued by the Hubrecht Laboratory (see B). The rest are reprints received on request. To this end nearly all titles relating to developmental biology are regularly extracted from a number of important review journals.

#### B *Reprint exchange*

Until recently the Institutes and research groups appearing on the mailing list of the Hubrecht Laboratory automatically received all publications issued by the Laboratory. In order to secure a more efficient and wider distribution a different system has been adopted. At regular intervals lists of titles of the reprints available are now sent out, and the recipients are requested to check off and return the list. At the same time the mailing list has been extended.

#### C *Services rendered by the C.E.L.: conditions for borrowing*

1. Every embryologist can ask for information about literature of certain authors, for surveys of literature on certain subjects (according to the classification-system of the G.E.I.S.), for surveys of newly published literature, etc.
2. Every embryologist can borrow reprints which are not available in his own country. Books and Normal tables are usually not lent out, volumes of periodicals are only lent out to investigators in the Netherlands.

##### Conditions:

- a. Reprints may be borrowed for 3 months at the utmost (for the Netherlands 1 month), time for shipment not included.
  - b. The receipt added to the consignment must be returned by return of post, after having been controlled and signed.
  - c. In case of high forwarding charges these have to be partly carried by the applicant.
3. Every embryologist can personally consult the C.E.L. at all times.
  4. The C.E.L. will be at the disposal of every embryologist working at the Hubrecht Laboratory.

### IV The Central Embryological Collection of slides and material

#### A *Concise Catalogue*

Copies of the "Concise Catalogue" of the Collection, which was issued in 1953, are still available on request.

#### B *Conditions for borrowing*

##### Conditions:

1. Slides, material in paraffin and/or material in alcohol can only be borrowed for one year, after which it has to be returned automatically if no special request for extension of the loan has been made by the investigator and has been approved by the staff of the Hubrecht Laboratory.

2. Material in alcohol or paraffin has to be returned as such or in the form of well prepared slides which have been sectioned, stained and embedded properly, clearly labeled (name of species, thickness and direction of sectioning, method of staining, etc.) and numbered according to given indications.
3. Costs of transport may be charged if these exceed reasonable limits.
4. Two copies of those publications dealing with material from the Central Embryological Collection should be sent to the Central Embryological Library of the Hubrecht Laboratory.
5. If material of the Central Embryological Collection has been used in investigations, it is respectfully requested that this be indicated in the publications concerned.

Restrictions:

6. Very rare or regularly consulted material can only be studied at the Hubrecht Laboratory.
7. Material of great historical value cannot be lent out.
8. If material has not been treated properly or (after special request) has not been returned in time by an investigator, material will no longer be lent out to the person in question.

## V Photographic Reproduction Service

The Hubrecht Laboratory makes photostats on request of papers present in the Central Embryological Library or borrowed from elsewhere. The negatives will remain at the Laboratory.

"ISTORIA EMBRIOLOGII V ROSSII"  
(A history of Rusian Embryology)  
1955

by L. J. Blacher  
375 pp., 48 figs.  
and several portraits

Izdatelstvo Akademii Nauk SSSR  
Moscow

We only announce this book, which is written in Russian, by title. The author is Head of the Department for the History of Biology, Institute for the History of Natural Sciences and Technique, Academy of Sciences of the U.S.S.R.

"PROBLEMES ET CONCEPTS DE L'EMBRYOLOGIE  
EXPERIMENTALE"  
1958

by L. Gallien  
(l'Avenir de la science, N.S., N.4)  
586 pp., 221 figs.

Gallimard, Paris  
Price: Fr. 2500

The author of this book has aimed at filling up a gap existing in the biological literature written in the French language. He has designed his book particularly for the use of advanced biology students, and has devoted particular care to didactic aspects.

Owing to size limitations some aspects of the subject had to be eliminated or treated very briefly. This holds for gametogenesis, larval development and regeneration, as well as for biochemical aspects.

The author has not tried to be exhaustive in his treatment of the various topics. He rather gives details only of such typical experiments as are best suited to illustrate particular principles.

The book contains 17 chapters. The first two are introductory, and among other things contain a short survey of experimental techniques. The following two chapters describe the organization of the egg cell, and the development of seven fundamental egg types. Then follow five chapters dealing with the concepts of preformation (mosaic development), regulation, determination, field and gradient, with examples from many animal groups, but principally from echinoderm and amphibian development.

The next five chapters deal with the problem of induction. The discussion starts with the organizer concept, and continues with regional factors in induction, the nature of the induction process, induction phenomena in various vertebrates and invertebrates, and finally the role of induction in organogenesis.

The last three chapters of the book are devoted to nuclear activities in development, and to the problems of sex development.

The manuscript of the book was finished in 1956. Consequently the most recent advances are not included.

The bibliography comprises 32 pages. There are author and subject indexes.

It is a pity that, owing to the poor quality of the paper, several of the more finely detailed figures have become blurred very badly. The binding of the book is unfortunately also very poor.

“GRUNDRISS DER ENTWICKLUNGSGESCHICHTE  
DES MENSCHEN”  
5th revised edition, 1959

by O. Grosser †  
(revised by R. Ortmann)  
176 pp., 200 figs.

Springer-Verlag  
Berlin, Göttingen, Heidelberg  
Price: D.M. 19.80

The fourth edition of this book, revised by G. Politzer, appeared in 1953. The present edition has retained about the same size, but the illustrative material, the most outstanding feature of the book, has been extended. The subdivision of the subject matter according to germ layers has been abandoned. Some chapters had to be brought up to date, and results obtained with new techniques have been included in appropriate places.

“COMPARATIVE ANATOMY”  
1959

by W. Montagna  
397 pp., 233 figs.

John Wiley & Sons, Inc.  
New York  
Price: \$ 6.00

The author of this book has spent much care on making the subject matter presented attractive for the reader. One of his means has been to lay more stress than usual on the functional aspects of the various organ systems.

More interest and insight is also secured by emphasizing developmental events. An introductory chapter of 20 pages deals with the development of the vertebrate body plan. Moreover most chapters contain rather long sections on the embryonic development of the organ system concerned.

Another very attractive feature of the book is its lay-out and the illustrative material used. The numerous line drawings are beautifully executed and of exceptional clarity. The photographic illustrations have been carefully selected and in many instances provide a very welcome link with the living organism. The printing is very clear.

Each chapter ends with a comprehensive summary and a short list of suggested reading. The book is concluded by an anatomical glossary and an alphabetical index.

"REPRODUCTIVE PHYSIOLOGY,  
Comparative Reproductive Physiology  
of Domestic Animals, Laboratory Animals and Man"  
1958

by A. V. Nalbandov  
271 pp., 38 figs., 56 tbs.

W. H. Freeman and Company  
San Francisco  
Price: \$ 6.75

The present book follows the comparative approach. It has grown from a lecture course given to students of various different disciplines, and is apparently meant for the use of graduate students. It is based on data of birds and mammals, including man.

It seems of no use to enumerate the various chapters. It may be sufficient to state the following. The histology, embryology and anatomy of the reproductive systems are treated concisely. The main stress in the work is on the role of the endocrine glands and the mode of action of hormones. Short chapters are devoted to the germ cells and to fertilization (12 pages), to early developmental stages and processes (12 pages), and to ovulation and fertilization rates and embryonic mortality (13 pages). A concluding chapter discusses fertility and sterility.

The number of references given is restricted, and so is the number of illustrations. There is a good subject index.

"AN OUTLINE OF DEVELOPMENTAL PHYSIOLOGY"  
2nd revised edition, 1959

by Chr. P. Raven  
224 pp., 64 figs., 10 pls.

Pergamon Press  
London, New York, Paris, Los Angeles  
Price: 25 s.

This book has already become widely known since its first English edition appeared in 1954. It was originally written for non-biologists, but has also proved to be of value for undergraduate biology students, because of its didactic qualities.

The second English edition has been enlarged by the incorporation of new results. The list of references has been extended by several important recent papers.

"LA FONCTION SPERMATOGENETIQUE DU TESTICULE  
HUMAIN"  
1958

Colloquium organized by  
H. Bayle, C. Gouygou and G. Guillon  
416 pp., 137 figs., 6 pls.

Masson et Cie  
Paris

This book is a collection of the papers given at a colloquium held in Paris in 1958. For the embryologist mainly the first ten papers (143 pages) are of

interest. These deal with anatomy and embryology of the human testis, normal spermatogenesis, ultrastructure of sperm, and normal physiology of spermatogenesis (vascular, nervous, hormonal and genetical factors). The rest of the book is almost exclusively of medical interest.

Most papers are followed by short lists of references. The book lacks an alphabetical index.

“THE CELLULAR SLIME MOLDS”  
1959

by J. T. Bonner  
149 pp., 13 figs. and 8 pls.

Princeton Univ. Press  
Price: \$ 4.00

In this book a comprehensive survey is given of descriptive and experimental work carried out up till now on the organisms belonging to the group of the Acrasiales. These interesting organisms are more and more considered to be particularly useful in the study of development, and it is especially from this point of view that the author summarizes the work, and tries to give an interpretation of the facts.

In the first chapter a short description is given of those primitive colonial organisms which are often unjustly associated with the Acrasiales, and a few points concerning the significance of aggregation in biology are discussed. The second chapter examines the nature of the various members of the Acrasiales and the mechanics of their development. The third chapter deals with the various morphogenetic movements occurring during the aggregation, migration and culmination phases.

Finally a chapter devoted to the problem of differentiation summarizes a number of recent investigations pointing to the importance of cell-variation for differentiation in these organisms.

The book is concluded by an extensive bibliography.

“BIOCHEMICAL CYTOLOGY”  
2nd printing, 1958

by J. Brachet  
535 pp., 190 figs.

Academic Press  
New York and London  
Price: \$ 8.80

The first printing of this book appeared more than two years ago, but was not announced in this journal. Now that a second printing has seen the light, it seems justified to make up for this omission.

The book has grown from lectures. Its principal aim is to provide a link between the more or less separate disciplines of cytology, biochemistry and genetics in the form of a handbook. The author himself warns the reader to regard the contents of his book with caution, since it deals with recent rather than well-established facts and ideas. On the other hand, the name of the author warrants the most up-to-date treatment of the subject matter.

The chapter which is of most interest to embryologists is the one dealing with “the nucleus and the cytoplasm in embryonic differentiation” (82 pages). It is preceded by chapters on the cytoplasm and nucleus of the resting cell, on mitosis, nucleic acids in heredity and protein synthesis, and nucleocytoplasmic interactions in unicellular organisms. The book is opened by brief historical and technical surveys, and closed by a short chapter on cancer cells, and a

few final remarks, mainly concerning the meaning of such notions as "life" and "living".

Literature references are given at the end of each chapter. The book further contains a subject and an author index. It is illustrated mainly with photomicrographs and graphs.

"THE CELL,  
Biochemistry, Physiology, Morphology"  
Vol. I, 1959

Editors: J. Brachet and A. E. Mirsky  
816 pp., 124 figs.

Academic Press  
New York and London  
Price: \$ 22.—

The present book is the first of three volumes. Together they will form one of the increasingly common collaborative treatises, written by a large group of co-authors. The number of contributors to volume I is twenty. Twelve of these are from the U.S.A.

Volume I consists of two parts. The first part deals with cytological, cytochemical and related methods. The last of its eight chapters discusses cellular autonomy and cellular interrelations as studied by "tissue culture" techniques. The second part, entitled "Problems of cell biology", consists of fifteen chapters, which are nearly all of direct interest to embryologists. Among the subjects are: fertilization, sex determination, differentiation, nucleo-cytoplasmic interactions, and the acquisition of biological specificity.

Each author has organised his chapter in his own way. In some chapters summaries are given at the end of each section; others have a general summary, or a more or less theoretical concluding section. Each chapter is preceded by a detailed table of contents, and followed by a list of references. Illustrations have been used sparingly; some chapters are not illustrated at all. The book is concluded by an author index and a very detailed subject index.

Volumes II and III of the book will deal respectively with cell constituents, mitosis, meiosis, and specialized cells.

"CONGENITAL ANOMALIES OF THE VISCERA,  
Their embryological basis"  
1957

by J. L. Bremer  
202 pp., 89 figs.

Harvard Univ. Press  
Cambridge, Mass.  
Price: \$ 5.00

This book is meant particularly for the use of pediatricians, pathologists and surgeons, who in the existing text books will often search in vain for data regarding the embryology of certain malformations.

In 11 chapters the most commonly encountered abnormalities of the viscera are discussed. The sequence is topographical rather than strictly systematical, which facilitates the clinical use of the book. In each chapter the discussion of developmental abnormalities grows logically from a simple, but clear description of the normal developmental events. The nervous system is not taken into account. Four chapters have been allotted to the heart and the great vessels.

Among the illustrations a large place has been given to simple diagrams. Lists of references are provided for each chapter, and the book is concluded by a subject index.

## "REPRODUCTION IN DOMESTIC ANIMALS"

1959

Editors: H. H. Cole and P. T. Cupps  
1102 pp., 200 figs.

Academic Press  
New York and London  
Price: \$ 27.50

The present book is a collaborative treatise written by nearly thirty co-authors. It consists of two volumes.

Volume I deals only with mammals. Chapters of special interest to embryologists are those on fertilization and egg development (31 pages), and on implantation and fetal development (33 pages). The former is based mainly on research in rodents, while in the latter the subject matter is treated separately for the Artiodactyla, the Perissodactyla and the Carnivora respectively. The other chapters of Volume I deal with development and anatomy of reproductive organs, sex differentiation, endocrine mechanisms, estrous cycles of the cow, mare, ewe, doe, sow and dog, and with gestation and lactation.

Volume II deals with spermatogenesis, physiology of semen, artificial insemination, nutrition and other environmental factors in reproduction, fertility, and finally with reproduction in the fowl.

The work is beautifully illustrated. Lists of references follow each chapter. Both volumes are concluded by author and subject indexes.

## "L'EMBRYOLOGIE DE L'OEIL ET SA TERATOLOGIE"

1958

by Ch. Dejean, G. Leplat and Fr. Hervouët  
728 pp., 534 figs, 10 coloured pls.

Masson et Cie  
Paris  
Price: fr. 8.000

This book has been written at the request of the Société Française d'Ophtalmologie, and is meant primarily for the use of ophthalmologists. It is concerned for the far greater part with the human eye.

The work has been divided between three authors, one of whom is a Belgian. Attempts at unification of the three contributions had to be omitted for practical reasons, so that double treatment of some points could not be avoided.

The book is opened by two chapters treating the earliest stages of eye development, and the developmental mechanics of the eye. Then follows the main portion of the book, the description of the normal development of the eye and its associated structures. This is immediately followed by a short chapter in the form of a normal table, summarizing the main events according to approximate age and length of the embryo. The last chapter extensively treats the teratology of the eye.

The book is profusely illustrated, mainly with photomicrographs. An extensive bibliography follows each chapter, and an alphabetical index concludes the book.

## "IMPLANTATION OF OVA"

1959

Editor: P. Eckstein  
(Memoirs of the Society for Endocrinology, no. 6)  
97 pp., 6 pls., several figs. and tabs.

Cambridge Univ. Press  
London  
Price: 30 s.

This is a report of a symposium held in London in 1957. It had 18 participants, most of them from England. The report consists of ten papers, each

followed by a bibliography and a group discussion. Much of the research reported on was not published previously. The papers cover morphological, biochemical, endocrinological and pharmacological aspects of ovum implantation in various mammals. The book contains a number of excellent photographic illustrations.

These two volumes constitute an unaltered reprinting of the original edition of 1930, to which has been added an obituary of the author by A. C. Hardy. Volume I contains the chapters on "hard", volume II those on "soft anatomy".

The size of the volumes is handy. Notwithstanding the relatively low price, the quality of the paper is good, and the binding firm. The figures are mostly well reproduced.

This conference report consists of 34 papers. At least five of these are of direct embryological significance, but embryologists working on pigment cell formation may want to read many of the other papers, e.g. those on endocrinology of pigment formation, and on tissue culture, centrifugation, irradiation, histochemistry, growth, metabolism, enzyme activity and electron microscopy of pigment cells.

"DEVELOPPEMENT DU COMPLEXE HYPOTHALAMO-

Nancy

This monograph is the report of very thorough study on the development, morphology and histo-physiology of the hypothalamic-hypophyseal complex in the chick, carried out with histological and histochemical methods.

The work is divided into five parts. The first part deals with the organogenesis and cytogenesis of the pituitary gland. The second part describes the organogenesis and histogenesis of the neurohypophysis and neighbouring structures. The third part is devoted especially to the development of the vascularization of the hypophysis. The last two parts deal with the development of neuro-secretory activity respectively in the hypothalamo-hypophyseal complex, and in the ependyma of the 3rd ventricle, particularly in its specific-

ally differentiated parts, the sub-commissural, the paraventricular and the subfornical organs.

The work is illustrated with more than 130 photomicrographs. The bibliography comprises 38 pages.

"BLASTOGENESE DES MENSCHEN"  
1959

by K. Mazanec  
179 pp., 118 figs.

VEB Gustav Fischer Verlag  
Jena  
Price: D.M. 20.60

This monograph is an extended translation of the original Czech edition of 1953. It deals with the developmental period from 0 till about 21 days (i.e., until the appearance of the first somites). This developmental period is subdivided into seven epochs, according to Streeter's criteria. The book opens with a brief critical survey of all the embryonic material of this period available up till about 1956. Then follows a continuous description of the developmental processes, based on this material, a short chronological survey, and a summary.

The illustrations are printed on special paper. The greater part of the figures

are drawings (partly graphical reconstructions of approximately median sections), the rest are photomicrographs. The quality of reproduction of the latter is reasonable.

The bibliography contains 228 titles. The book contains author and subject indexes.

“A SYMPOSIUM ON  
THE CHEMICAL BASIS OF DEVELOPMENT”  
1958

Editors: W. D. McElroy and B. Glass  
934 pp., more than 272 figs.

The Johns Hopkins Press  
Baltimore, Md.  
Price: \$ 15.—

The present book consists of 42 papers and discussions presented during a symposium held under the sponsorship of the McCollum-Pratt Institute of the Johns Hopkins University.

The subject matter is subdivided into four sections, viz. “developmental cytology” (8 papers), “cellular and tissue interactions in development” (7), “problems of specificity in growth and development” (16), and “control mechanism in development” (11). The book is concluded by a systematic summary of the entire symposium written by one of the editors (68 pages).

The collaborators to this book form a truly international company, including many of the leading authorities in the field of developmental biology.

The scope of many papers is wider than the title of the book suggests, i.e. higher levels of organization than the purely chemical one are amply discussed.

Literature references follow each paper. The book contains an index to names of participants, and an extensive subject index.

“RECHERCHES D'EMBRYOLOGIE EXPERIMENTALE”  
Vol. I, 1958

by B. Menkes  
807 pp., 429 figs.

Edit. Acad. Republ. Populare  
Romine

The present book is a collection of reports of investigations carried out by a research group in experimental embryology at the Scientific Research Basis of the Roumanian Academy in Timișoara, Roumania. The book is written in Roumanian, but it contains a summary and a list of explanations of figures in French, comprising 30 pages. This enables the interested reader to form an idea about the character and the theoretical background of these investigations. The latter is formed by the materialistic-dialectic doctrine and the ideas of its scientific exponents.

The investigations have been carried out exclusively on avian embryos. Extensive methodological information is supplied. The principal research objects have been the following: the development of “reactivity” of the embryo and extra-embryonic organs (phagocytosis, hyperplasia, grafting, infection, effects of surgery of the central nervous system); the biology of xenoplastic skin grafts; the function of some embryonic organs (meso- and metanephros; liver and yolk; heart and surrounding mesenchyme); certain developmental correlations (between nutrition and respiration; between embryo and yolk sac; between embryo and area vasculosa; significance of allantoic circulation and sub-embryonic fluid).

128 pp., 27 figs. and portrait of the author

Johan Ambrosius Barth Verlag  
Leipzig  
Price: D.M. 6.80

This monograph was published after the death of its author. It is his last scientific work. The editor has provided it with a biographical and historical preface.

The author's starting point is the idea that the embryo at every moment of its life must form a well-balanced functional unity, adapted to the changing internal and external circumstances, notwithstanding the fact that some of its constituent parts will acquire their proper functions only at much later stages. Some of these parts acquire temporary functions of a different nature.

The problems which result from the conflicting demands put to the embryo, are illustrated with many examples from different developmental periods and organ systems. The conclusions at which the author arrives are often very hypothetical and speculative. Nevertheless it is interesting to take notice of a train of thought which has up till now been neglected too much.

Price: D.M. 35.—

The first edition of this book appeared in 1952. The present edition has been considerably extended. The size has increased by 158 pages (nearly 50%). Fifteen figures were added. Many new results could be incorporated. Entirely new chapters were written on postembryonic development, growth and diapause (particularly the external factors influencing them), biochemical development, and the influence of the nervous system on muscle development.

The manuscript of the second edition was already finished in 1955, but the literature of 1956 and 1957 could be included in the bibliography. This is now more than twice as long as in the first edition (77 pages).

## "REGENERACIJA I SOMATIČESKIJ EMBRIOGENEZ" (Regeneration and somatic embryogenesis)

1959

by B. P. Tokin  
267 pp., 83 figs.

Published by the  
University of Leningrad

In the present monograph the phenomena of regeneration and somatic embryogenesis (i.e. development from cells other than gametes) in plants and animals are compared, and discussed against the background of what is known about "sexual" embryogenesis (development from gametes).

Special attention is paid to such problems as: integration of the organism, determination of cells, regulation, organization, evolution and ontogenesis of regenerative capacities, behaviour of cells and tissues during regeneration, and the relations between regeneration and tumor growth.

In the bibliography the Russian titles occupy six of the nine pages.

## "ENTWICKLUNGSGESCHICHTE UND FEHLBILDUNGEN DER WIRBELSÄULE"

1958

by G. Töndury  
(Die Wirbelsäule in Forschung  
und Praxis, Band 7)  
196 pp., 173 figs.

Hippokrates-Verlag  
Stuttgart

This extremely thorough monograph will primarily be of interest to human anatomists and medical practitioners. It starts with an extensive account of the normal development of the vertebral column in man. Then follows a short chapter summarizing the data on the developmental physiology of the vertebral column in non-mammalian vertebrates, resulting from direct surgical intervention. This chapter is followed by a chapter on abnormalities of the spinal column in mammals, produced by indirect methods, such as irradiation, reduction of oxygen supply and various genetical factors. The concluding chapter discusses the abnormalities of the spinal column in man.

The quality of the numerous illustrations, mostly photographs, is above all criticism, and so is the printing of the book. It is rounded off by a bibliography and a subject index.

This series constitutes a complete record of a series of developmental biology conferences held in 1956 under the auspices of the National Academy of Sciences — National Research Council (U.S.A.). Among the participants were nearly 300 scientists from the U.S.A., and 54 scientists from 19 other countries. Each conference had a reporter, who took care of the editorial work for the report.

The conferences usually took the form of a mixture of individual research reports, and general discussions centering around key questions put forward by the chairman, a distinguished authority in the field in question.

Most books contain more or less continuous reports of the proceedings, some almost verbal renderings, others more freely conceived accounts. Lists of references either follow individual papers, or are given at the end of the book. In two cases (nos. 5 and 6) only key references have been given.

Much care has been devoted to the printing and binding of the books, and the outcome forms a very attractive series, which will certainly find its way to those embryologists who like to read lively and stimulating discussions of a number of topics which are at present in the centre of interest.

"PROBLEMY SOVREMENNOJ EMBRIOLOGII"

(Problems of contemporary embryology)

1956

Proc. Leningrad  
Embryol. Conf. 1955  
400 pp., many figs.

Published by the Leningrad  
State University

This book is an extensive conference report, consisting of 62 papers. For those who read Russian, it reflects the contemporary situation in the U.S.S.R. in many fields of embryological research, with the emphasis on animal embryology.

The papers are arranged in the following sections: germ cells, fertilization and early stages (12 papers, of which 6 botanical); embryonic histogenesis (7 papers); developmental periodization (7 papers); embryology and evolution (6 papers); physiology of development (7 papers); human and pathological embryology (6 papers); embryonic immunity (8 papers); regeneration and asexual reproduction (6 papers, of which 1 botanical). The last section is devoted to more general considerations of the task of contemporary (especially Soviet) embryology.
